

# **2008 Annual Drinking Water Report** **(Amended)**

River Rock Subdivision  
PWSID# MT0004082

We are very pleased to provide you with this year's Annual Quality Water Report. We want to keep you informed about the excellent water and services we have delivered to you over the past year. Our goal is and always has been, to provide to you a safe and dependable supply of drinking water. This report shows our water quality and what it means.

River Rock Subdivision routinely monitors for constituents in your drinking water according to Federal and State laws. This table shows the results of our monitoring for the period of January 1st to December 31st, 2008. Our sampling frequency complies with EPA and State drinking water regulations.

In the table below you will find many terms and abbreviations that may not be familiar to you. To help you better understand these terms we've provided the following definitions and information:

- *Maximum Contaminant Level (MCL)* - The highest level of a contaminant that is allowed in drinking water.
- *Parts per million (ppm) or milligrams per liter (mg/l)* - one part per million corresponds to one minute in two years or a single penny in \$10,000.
- *Parts per billion (ppb) or micrograms per liter* - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

All sources of drinking water are subject to potential contamination by constituents that are naturally occurring or man made. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

MCL's are set at very stringent levels. To understand the possible health effects described for many regulated constituents, a person would have to drink 2 liters of water every day at the MCL level for a lifetime to have a one-in-a-million chance of having the described health effect.

The Total Coliform Rule requires water systems to meet a stricter limit for coliform bacteria. Coliform bacteria presence in water can be an indication of disease-causing bacteria. When coliform bacteria are found, special follow-up tests are done to determine if harmful bacteria are present in the water supply. If this limit is exceeded, the water supplier must notify the public. To comply with the stricter regulation, we have selected proper sampling sites and have complied with repeat monitoring.

Test Results						
Contaminant	Violation (Y/N)	Sample Date	Highest Level Detected	Unit Measurement	MCL	Possible Source of Contamination
<b>Microbiological Contaminants</b>						
Total Coliform Bacteria	Y	Monthly	1	N/A	Presence of coliform bacteria in 5% of monthly samples	Naturally present in the environment, sewage leaks, runoff from livestock areas
Fecal ( <i>E. coli</i> )	N	Monthly	0	N/A		
<b>Lead and Copper</b>						
Lead <sup>1</sup>	N	09/25/08	0	ppb	Allowed amount 15ppb	Corrosion of household plumbing systems, erosion of natural deposits
Copper	N	09/25/08	0.27	ppm	Allowed amount 1.3 ppm	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
<b>Inorganic Contaminants</b>						
Nitrate +Nitrite (as Nitrogen)	N	10/31/08	0.634	ppm	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural deposits

Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially-harmful, bacteria may be present. Coliforms were detected during the June sampling. The duration of the violation was until repeat samples were analyzed. The repeat samples were all in compliance with the Total Coliform Rule.

Thank you for allowing us to continue providing your family with clean, quality water this year.

This report was generated by: Bridger Analytical Lab, Inc. Bozeman, MT- January 2009.

---

<sup>1</sup> If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The Garden Center Subdivision is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.
